Electro- Mechanical Assembly Portfolio

Projects by :
Eliyahu Dahan

Prepared for :
VAST

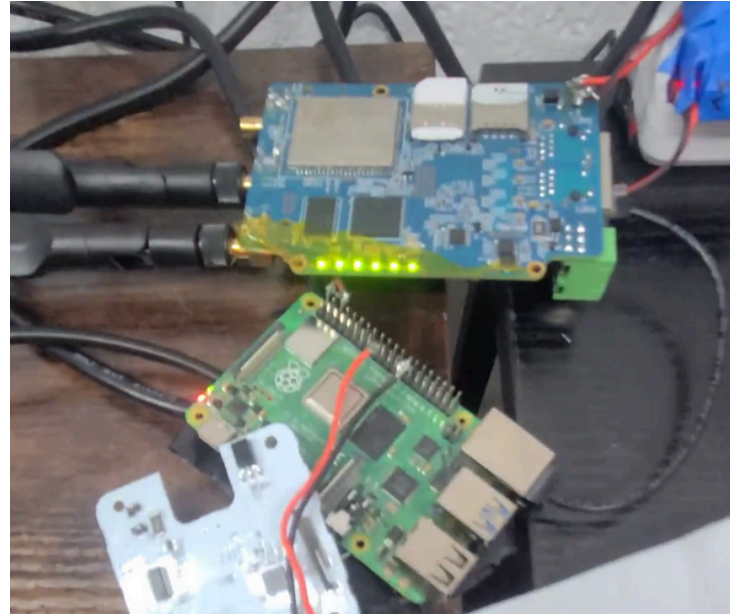

Project 1

6s2p Drone Battery Pack

Description:

I designed and assembled a custom 6s2p lithium-ion battery pack for a drone build, as well as creating the welding pattern to optimize voltage and current flow. The pack was TIG welded, then wired and harnessed for power delivery. I soldered and connected the balance lead to enable proper cell monitoring and charging. Continuity and voltage tests were performed to confirm reliability before integration into the drone system.

Project 2

Delet Hub Prototype

Description:

At Delet, I worked on building a prototype electronics hub by soldering and assembling PCBAs, integrating a power supply, and wiring all components together. I tested the system under load to verify performance and reliability, and used Python scripts to connect and control the different devices within the hub. To complete the build, I 3D-printed the housing and supporting parts to bring the final prototype together.
